Blochemistry 28:9324-9331(1989).

-i- FUNCTION: IS ABLE TO INHIBIT ALL FOUR CLASSES OF PROTEINASES BY A UNIQUE "TRAPPING" MECHANISM. THIS PROTEIN HAS A PEPTIDE STRETCH, CALLED THE 'BAIT REGION' WHICH CONTAINS SPECIFIC CLEAVAGE SITES FOR DIFFERENT PROTEINASES. WHEN A PROTEINASE CLEAVES THE BAIT REGION, A CONFORMATIONAL CHANGE IS INDUCED IN THE PROTEIN WHICH TRAPS THE PROTEINASE. THE ENTRAPPED ENZYME REMAINS ACTIVE AGAINST LOW MOLECULAR WEIGHT SUBSTRATES (ACTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES (ACTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES (BOLDED). FOLLOWING CLEAVAGE IN THE BAIT REGION A THIOLESTER BOND IS HYDROLYZED AND MEDIATES THE COVALENT BINDING OF THE PROTEIN TO THE PROTEINASE.

-i- SUBUNIT: HOMOTETRAMER, WHICH CONSISTS OF TWO PAIRS OF DISULFIDE-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: IS ABLE TO INHIBIT ALL FOUR CLASSES OF PROTEINASES BY A UNIQUE "TRAPPING" MECHANISM. THIS PROTEIN HAS A PEPTIDE STRETCH, CALLED THE 'BAIT REGION' WHICH CONTAINS SPECIFIC CLEAVAGE SITES FOR DIFFERENT PROTEINASES. WHEN A PROTEINASE CLEAVES THE BAIT REGION, A CONFORMATIONAL CHANGE IS INDUCED IN THE PROTEIN WHICH TRAPS THE PROTEINASE. THE ENTRAPED ENZYME REMAINS ACTIVE AGAINST LOW MOLECULAR WEIGHT SUBSTRATES (ACTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES (BEATLY REDUCED).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PTM: CONTAINS 56 MOL GLUCOSAMINE PER MOL SUBUNIT. SIMILARITY: TO OTHER PROTEINS OF THE ALPHA-MACROGLOBULIN FAMILY, INCLUDING COMPLEMENT COMPONENTS C3, C4, AND C5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBUNIT: HOMOTETRAMER, WHICH CONSISTS OF TWO PAIRS OF DISULFIDE

THIS PROTEIN HAS A PEPTIDE STRETCH, CALLED THE 'BAIT REGION' WHICH CONTAINS SPECIFIC CLEAVAGE SITES FOR DIFFERENT PROTEINASES. WHEN A PROTEINASE CLEAVES THE BAIT REGION, A CONFORMATIONAL CHANGE IS INDUCED IN THE PROTEIN WHICH TRAPS THE PROTEINASES. THE ENTRAPPED ENZYME REMAINS ACTIVE AGALNST LOW MOLECULAR WEIGHT SUBSTRATES (ACTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES IS GREATLY REDUCED). FOLLOWING CLEAVAGE IN THE BAIT REGION A THIOLESTER BOND IS TUDROLYZED AND MEDIATES THE GREAT SUBSTRATES THE BAIT REGION AND MEDIATES THE

-I- FUNCTION: DERIVED FROM PROTEOLYTIC DEGRADATION OF COMPLEMENT C4, C4A ANAPHYLATOXIN IS A MEDIATOR OF LOCAL INFLAMMATORY PROCESS. IT INDUCES THE CONTRACTION OF SMOOTH MUSCLE, INCREASES VASCULAR PERMEABILITY AND CAUSES HISTAMINE RELEASE FROM MAST CELLS AND BASOPHILIC LEUKOCYTES.

-I- SUBUNIT: THIS PROTEIN IS SYNTHESIZED AS A SINGLE-CHAIN PRECURSOR AND, PRIOR TO SECRETION, IS ENZYMATICALLY CLEAVED TO FORM A TRIMER OF MONIDERICAL CHAINS (ALPHA, BETA, AND GAMMA).

-I- POLYMORPHISM: HUMAN COMPLEMENT COMPONENT C4 IS POLYMORPHIC WITH AT LEAST TWO LOCI, C4A AND C4B. 13 ALLELES OF C4A AND 22 ALLELES OF C4B HAVE BEEN DETECTED. THE ALLELES CARRY THE BLOOD GROUP RODGERS WHILE THE C4B ALLELES CARRY THE BLOOD GROUP RODGERS WHILE THE C4B ALLELES CARRY THE BLOOD GROUP CHIDO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=87080272; PubMed=2431902;

ITS PROCESSING BY C3 CONVERTASE IS THE CENTRAL REACTION IN BOTH CLASSICAL AND ALTERNATIVE COMPLEMENT PATHWAYS. AFTER ACTIVATION C3B CAN BIND COVALENTLY, VIA ITS REACTIVE THIOLESTER, TO CELL SURFACE CARBOHYDRATES OR IMMUNE AGGREGATES. SUBUNIT: C3 PRECURSOR IS FIRST PROCESSED BY THE REMOVAL OF 4 ARG RESIDUES, FORMING TWO CHAINS, BETA & ALPHA, LINKED BY A DISULFIDE BOND. C3 CONVERTASE ACTIVATES C3 BY CLEAVING THE ALPHA CHAIN,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBUNIT: C3 precursor is first processed by the removal of 4 Arg residues, forming two chains, beta and alpha, linked by a disulfide bond. C3 convertase activates C3 by cleaving the alpha chain, releasing C3A anaphylatoxin and generating C3B (beta chain + alpha' chain) (By similarity).

SIMILARITY: TO C4, C5 AND ALPHA-2-MACROGLOBULIN.
SIMILARITY: Contains 1 anaphylatoxin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: C3 PLAYS A CENTRAL ROLE IN THE ACTIVATION OF THE COMPLEMENT SYSTEM, ITS PROCESSING BY C3 CONVERTAGE IS THE CENTRAL REACTION IN BOTH CLASSICAL AND ALTERNATIVE COMPLEMENT PATHWAYS. AFTER ACTIVATION C3B CAN BIND COVALENTLY, VIA ITS REACTIVE THIOLESTER, TO CELL SURFACE CARBOHYDRATES OR IMMUNE AGGREGATES. FUNCTION: DERIVED FROM PROTEOLYTIC DEGRADATION OF COMPLEMENT C3, C3A ANAPHYLATOXIN IS A MEDIATOR OF LOCAL INFLAWMATORY PROCESS. IT INDUCES THE CONTRACTION OF SMOOTH MUSCLE, INCREASES VASCULAR DERMEABILLTY AND CAUSES HISTAMINE RELEASE FROM MAST CELLS AND

J. Biol. Chem. 264:16941-16947 (1989).

-IF FUNCTION: C3 PLAYS A CENTRAL ROLE IN THE ACTIVATION OF THE COMPLEMENT SYSTEM. ITS PROCESSING BY C3 CONVERTASE IS THE CENTRAL REACTION IN BOTH CLASSICAL AND ALTERNATIVE COMPLEMENT PATHWAYS. AFTER ACTIVATION C3B CAN BIND COVALENTLY, VIA ITS REACTIVE THIOLESTER, TO CELL SURFACE CARBOHYDRATES OR IMMUNE AGGREGATES.
-IF FUNCTION: DERIVED FROM PROTEOLYTIC DEGRADATION OF COMPLEMENT C3, C3A ANAPHYLATOXIN IS A MEDIATOR OF LOCAL INFLAMMATORY PROCESS. IT INDUCES THE CONTRACTION OF SMOOTH MUSCLE, INCREASES VASCULAR PERMEABILITY AND CAUSES HISTAMINE RELEASE FROM MAST CELLS AND BASOPHILIC LEUROCYTES.
-ISUBUNIT: C3 PRECURSOR IS FIRST PROCESSED BY THE REMOVAL OF 4 ARG RESIDUES, FORMING TWO CHAINS, BETA & ALPHA, LINKED BY A DISULFIDE BOND. C3 CONVERTASE ACTIVATES C3 BY CLEAVING THE ALPHA CHAIN, RELEASING C3A ANAPHYLATOXIN & GENERATING C3B (BETA CHAIN + ALPHA')
                                                                                                                                                                                                                                                                                                                                                                   use

FUNCTION: DERIVED FROM PROTECLYTIC DEGRADATION OF COMPLEMENT C3, C3A ANAPHYLATOXIN IS A MEDIATOR OF LOCAL INFLAMMATORY PROCESS. IT INDUCES THE CONTRACTION OF SMOOTH MUSCLE, INCREASES VASCULAR PREMERBILITY AND CAUSES HISTAMINE RELEASE FROM MAST CELLS AND BASOPHILIC LEUKOCYTES. THE SHORT ISOFORM HAS B-CELL STIMULATORY ACTIVITY.

SUBUNIT: C3 precursor is first processed by the removal of 4 Arg residues, forming two chains, beta and alpha, linked by a disulfide bond. C3 convertase activates C3 by cleaving the alpha, chain, releasing C3A anaphylatoxin and generating C3B (beta chain, releasing C3A anaphylatoxin and generating C3B (beta chain).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Buropean Bioinformatics Institute.
